

ABSTRACT OF THE DISCLOSURE

A lamp shade includes a shade, and a support structure mounted in the shade for supporting the shade. The support structure includes a first ring fixed on a first end of the shade, a second ring fixed on a second end of the shade, and an elastic member mounted between the first ring and the second ring. Thus, the lamp shade is folded when not in use so as to reduce the volume of the lamp shade, thereby facilitating package, storage and transportation of the lamp shade, and thereby decreasing the costs of transportation.
